CS 61A Week 14 Lab

Monday afternoon, Tuesday, or Wednesday morning

- 1. Lazy evaluator. Abelson and Sussman, exercises 4.27 and 4.29.
- 2. In this exercise we learn what a *continuation* is. Suppose we have the following definition:

```
(define (square x cont)
  (cont (* x x)))
```

Here x is the number we want to square, and **cont** is the procedure to which we want to pass the result. Now try these experiments:

```
> (square 5 (lambda (x) x))
> (square 5 (lambda (x) (+ x 2)))
> (square 5 (lambda (x) (square x (lambda (x) x))))
> (square 5 display)
> (define foo 3)
> (square 5 (lambda (x) (set! foo x)))
> foo
```

Don't just type them in – make sure you understand why they work! The nondeterministic evaluator works by evaluating every expression with two continuations, one used if the computation succeeds, and one used if it fails.
