CS 61A Week 11

Topic: Streams

Reading: Abelson & Sussman, Section 3.5.1–3, 3.5.5

Homework:

- 1. Abelson & Sussman, exercises 3.50, 3.51, 3.52, 3.53, 3.54, 3.55, 3.56, 3.64, 3.66, 3.68
- 2. Write and test two functions to manipulate nonnegative proper fractions. The first function, fract-stream, will take as its argument a list of two nonnegative integers, the numerator and the denominator, in which the numerator is less than the denominator. It will return an infinite stream of decimal digits representing the decimal expansion of the fraction. The second function, approximation, will take two arguments: a fraction stream and a nonnegative integer numdigits. It will return a list (not a stream) containing the first numdigits digits of the decimal expansion.

(fract-stream '(1 7)) should return the stream representing the decimal expansion of $\frac{1}{7}$, which is 0.142857142857...

```
(stream-car (fract-stream '(1 7))) should return 1.
(stream-car (stream-cdr (fract-stream '(1 7)))) should return 2.
(approximation (fract-stream '(1 7)) 4) should return (1 4 2 8).
```

(approximation (fract-stream '(1 2)) 4) should return (5 0 0 0).

Note: Next week is the third midterm.

Extra for experts:

- 1. Do exercises 3.59–3.62.
- 2. Consider this procedure:

It generates finite streams; here are the first few values:

```
      (hanoi-stream 1)
      (1)

      (hanoi-stream 2)
      (1 2 1)

      (hanoi-stream 3)
      (1 2 1 3 1 2 1)

      (hanoi-stream 4)
      (1 2 1 3 1 2 1 4 1 2 1 3 1 2 1)
```

Notice that each of these starts with the same values as the one above it, followed by some more values. There is no reason why this pattern can't be continued to generate an infinite stream whose first $2^n - 1$ elements are (hanoi-stream n). Generate this stream.

Unix feature of the week: diff, wc

Emacs feature of the week: M-a, M-e, M-{, M-}, M-<, M-> (move around buffer)
